

Fair use and private automation

Version: 1.0

Last updated: 24 August 2026

Rules for personal agents, digests and automated access.

Permitted scenarios

Personal search, local agents, private digests, internal non-commercial prototypes and data-quality research are allowed when source links are preserved.

Technical good faith

Prefer the API over site scraping, cache for at least 15 minutes, use backoff, honour Retry-After and avoid bulk parallel requests. Never bypass robots.txt, CAPTCHA, authentication or source restrictions.

Human control

Automation must not independently submit applications, message employers, accept terms or disclose personal data. Each such action requires explicit human approval for the specific recipient.

Public and commercial reuse

Bulk republication, a competing public aggregator, dataset sales or high-volume use require separate permission and an independent review of source licences.

Project status

The public site demonstrates an open-source library; it is not a commercial scraping-as-a-service offering. The project does not sell data access, accept protection-bypass commissions or promise access to any source.

Private automation means personal job search, local research or an internal non-commercial prototype. The user supplies infrastructure, configuration and lawful access rights.

Technical and legal limits

Do not use the project to bypass CAPTCHA, authentication, paywalls, account or IP blocks unless the resource owner authorised it or applicable law clearly permits it. Stop collection after a prohibition, complaint, 401/403/429 response, CAPTCHA demand or evident service degradation; prefer official APIs, low request rates and caching.

Minimisation and retention

Collect only fields needed for private vacancy search; do not build dossiers on people, enrich personal contacts or retain source pages longer than necessary. Do not publish a complete corpus or substantial part of a source database. Preserve attribution and direct links.
